

Unit 4:

Association Rules

Unit 4

Section 2: Advanced Concepts and Algorithms

Continuous and Categorical Attributes

How to apply association analysis formulation to non-symmetric binary variables?

| Session Id | Country | Session Length (sec) | Number of Web Pages viewed | Gender | Browser Type | Buy |
|------------|-----------|----------------------|----------------------------|--------|--------------|-----|
| 1 | USA | 982 | 8 | Male | IE | No |
| 2 | China | 811 | 10 | Female | Netscape | No |
| 3 | USA | 2125 | 45 | Female | Mozilla | Yes |
| 4 | Germany | 596 | 4 | Male | IE | Yes |
| 5 | Australia | 123 | 9 | Male | Mozilla | No |
| ... | ... | ... | ... | ... | ... | ... |

Example of Association Rule:

$\{\text{Number of Pages} \in [5, 10) \wedge (\text{Browser} = \text{Mozilla})\} \rightarrow \{\text{Buy} = \text{No}\}$

Handling Categorical Attributes

- ✗ TRANSFORM CATEGORICAL ATTRIBUTE INTO ASYMMETRIC BINARY VARIABLES
- ✗ INTRODUCE A NEW “ITEM” FOR EACH DISTINCT ATTRIBUTE-VALUE PAIR
 - ✗ Example: replace Browser Type attribute with
 - ✗ Browser Type = Internet Explorer
 - ✗ Browser Type = Mozilla
 - ✗ Browser Type = Mozilla

Handling Categorical Attributes

xPOTENTIAL ISSUES

xWhat if attribute has many possible values

- x Example: attribute country has more than 200 possible values
- x Many of the attribute values may have very low support
 - xPotential solution: Aggregate the low-support attribute values

xWhat if distribution of attribute values is highly skewed

- x Example: 95% of the visitors have Buy = No
- x Most of the items will be associated with (Buy=No) item
 - xPotential solution: drop the highly frequent items

Handling Continuous Attributes

x DIFFERENT KINDS OF RULES:

x $\text{Age} \in [21, 35) \wedge \text{Salary} \in [70k, 120k) \rightarrow \text{Buy}$

x $\text{Salary} \in [70k, 120k) \wedge \text{Buy} \rightarrow \text{Age}: \mu=28, \sigma=4$

x DIFFERENT METHODS:

x Discretization-based

x Statistics-based

x Non-discretization based

x minApriori

Handling Continuous Attributes

✗USE DISCRETIZATION

✗UNSUPERVISED:

- ✗Equal-width binning
- ✗Equal-depth binning
- ✗Clustering

✗SUPERVISED:

Attribute values, v

| Class | v_1 | v_2 | v_3 | v_4 | v_5 | v_6 | v_7 | v_8 | v_9 |
|-----------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Anomalous | 0 | 0 | 20 | 10 | 20 | 0 | 0 | 0 | 0 |
| Normal | 150 | 100 | 0 | 0 | 0 | 100 | 100 | 150 | 100 |

$\underbrace{\quad\quad\quad}_{\text{bin}_1}$
 $\underbrace{\quad\quad\quad\quad\quad}_{\text{bin}_2}$
 $\underbrace{\quad\quad\quad\quad\quad\quad\quad}_{\text{bin}_3}$

Discretization Issues

✗ SIZE OF THE DISCRETIZED INTERVALS AFFECT SUPPORT & CONFIDENCE

{Refund = No, (Income = \$51,250)} → {Cheat = No}

{Refund = No, (60K ≤ Income ≤ 80K)} → {Cheat = No}

{Refund = No, (0K ≤ Income ≤ 1B)} → {Cheat = No}

✗ If intervals too small

✗ may not have enough support

✗ If intervals too large

✗ may not have enough confidence

✗ POTENTIAL SOLUTION: USE ALL POSSIBLE INTERVALS

Discretization Issues

✗ EXECUTION TIME

✗ If intervals contain n values, there are on average $O(n^2)$ possible ranges

✗ TOO MANY RULES

$\{\text{Refund} = \text{No}, (\text{Income} = \$51,250)\} \rightarrow \{\text{Cheat} = \text{No}\}$

$\{\text{Refund} = \text{No}, (51\text{K} \leq \text{Income} \leq 52\text{K})\} \rightarrow \{\text{Cheat} = \text{No}\}$

$\{\text{Refund} = \text{No}, (50\text{K} \leq \text{Income} \leq 60\text{K})\} \rightarrow \{\text{Cheat} = \text{No}\}$

Approach by Srikant & Agrawal

- ✗ PREPROCESS THE DATA
 - ✗ Discretize attribute using equi-depth partitioning
 - ✗ Use *partial completeness measure* to determine number of partitions
 - ✗ Merge adjacent intervals as long as support is less than max-support
- ✗ APPLY EXISTING ASSOCIATION RULE MINING ALGORITHMS
- ✗ DETERMINE INTERESTING RULES IN THE OUTPUT

Approach by Srikant & Agrawal

✗ DISCRETIZATION WILL LOSE INFORMATION

✗ Use *partial completeness measure* to determine how much information is lost

C: FREQUENT ITEMSETS OBTAINED BY CONSIDERING ALL RANGES OF ATTRIBUTE VALUES

P: FREQUENT ITEMSETS OBTAINED BY CONSIDERING ALL RANGES OVER THE PARTITIONS

P IS *K*-COMPLETE W.R.T C IF $P \subseteq C$, AND $\forall X \in C, \exists X' \in P$ SUCH THAT:

1. X' IS A GENERALIZATION OF X AND $\text{SUPPORT}(X') \leq K \times \text{SUPPORT}(X)$ ($K \geq 1$)
2. $\forall Y \subseteq X, \exists Y' \subseteq X'$ SUCH THAT $\text{SUPPORT}(Y') \leq K \times \text{SUPPORT}(Y)$

GIVEN *K* (PARTIAL COMPLETENESS LEVEL), CAN DETERMINE NUMBER OF INTERVALS (N)

Interestingness Measure

$\{\text{Refund} = \text{No}, (\text{Income} = \$51,250)\} \rightarrow \{\text{Cheat} = \text{No}\}$

$\{\text{Refund} = \text{No}, (51\text{K} \leq \text{Income} \leq 52\text{K})\} \rightarrow \{\text{Cheat} = \text{No}\}$

$\{\text{Refund} = \text{No}, (50\text{K} \leq \text{Income} \leq 60\text{K})\} \rightarrow \{\text{Cheat} = \text{No}\}$

× GIVEN AN ITEMSET: $Z = \{z_1, z_2, \dots, z_k\}$ AND ITS GENERALIZATION $Z' = \{z_1', z_2', \dots, z_k'\}$

$P(Z)$: SUPPORT OF Z

$E_{Z'}(Z)$: EXPECTED SUPPORT OF Z BASED ON Z'

$$E_{Z'}(Z) = \frac{P(z_1)}{P(z_1')} \times \frac{P(z_2)}{P(z_2')} \times \dots \times \frac{P(z_k)}{P(z_k')} \times P(Z')$$

× Z is R-interesting w.r.t. Z' If $P(Z) \geq R \times E_{Z'}(Z)$

Interestingness Measure

✗ FOR $S: X \rightarrow Y$, AND ITS GENERALIZATION $S': X' \rightarrow Y'$

$P(Y|X)$: CONFIDENCE OF $X \rightarrow Y$

$P(Y'|X')$: CONFIDENCE OF $X' \rightarrow Y'$

$E_{S'}(Y|X)$: EXPECTED SUPPORT OF Z BASED ON Z'

$$E(Y|X) = \frac{P(y_1)}{P(y_1')} \times \frac{P(y_2)}{P(y_2')} \times \dots \times \frac{P(y_k)}{P(y_k')} \times P(Y'|X')$$

✗ RULE S IS R -INTERESTING W.R.T ITS ANCESTOR RULE S' IF

✗ Support, $P(S) \geq R \times E_{S'}(S)$ or

✗ Confidence, $P(Y|X) \geq R \times E_{S'}(Y|X)$

Statistics-based Methods

✗EXAMPLE:

Browser=Mozilla ^ Buy=Yes \rightarrow Age: $\mu=23$

✗RULE CONSEQUENT CONSISTS OF A CONTINUOUS VARIABLE, CHARACTERIZED BY THEIR STATISTICS

- ✗mean, median, standard deviation, etc.

✗APPROACH:

- ✗Withhold the target variable from the rest of the data
- ✗Apply existing frequent itemset generation on the rest of the data
- ✗For each frequent itemset, compute the descriptive statistics for the corresponding target variable
 - ✗Frequent itemset becomes a rule by introducing the target variable as rule consequent
- ✗Apply statistical test to determine interestingness of the rule

Statistics-based Methods

✗ HOW TO DETERMINE WHETHER AN ASSOCIATION RULE IS INTERESTING?

✗ Compare the statistics for segment of population covered by the rule vs segment of population not covered by the rule:

$$A \Rightarrow B: \mu \quad \text{versus} \quad A \Rightarrow B: \mu'$$

✗ Statistical hypothesis testing:

✗ Null hypothesis: $H_0: \mu' = \mu + \Delta$

✗ Alternative hypothesis: $H_1: \mu' > \mu + \Delta$

✗ Z has zero mean and variance 1 under null hypothesis

$$Z = \frac{\mu' - \mu - \Delta}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

Statistics-based Methods

✕EXAMPLE:

r: Browser=Mozilla ^ Buy=Yes → Age: $\mu=23$

✕Rule is interesting if difference between μ and μ' is greater than 5 years (i.e., $\Delta = 5$)

✕For r, suppose $n_1 = 50, s_1 = 3.5$

✕For r' (complement): $n_2 = 250, s_2 = 6.5$

$$Z = \frac{\mu' - \mu - \Delta}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}} = \frac{30 - 23 - 5}{\sqrt{\frac{3.5^2}{50} + \frac{6.5^2}{250}}} = 3.11$$

✕For 1-sided test at 95% confidence level, critical Z-value for rejecting null hypothesis is 1.64.

✕Since Z is greater than 1.64, r is an interesting rule

Min-Apriori (Han et al)

Document-term matrix:

| TID | W 1 | W 2 | W 3 | W 4 | W 5 |
|-----|-----|-----|-----|-----|-----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

Example:

W1 and W2 tends to appear together in the same document

Min-Apriori

- ✗ DATA CONTAINS ONLY CONTINUOUS ATTRIBUTES OF THE SAME “TYPE”
 - ✗ e.g., frequency of words in a document

| TID | W 1 | W 2 | W 3 | W 4 | W 5 |
|-----|-----|-----|-----|-----|-----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

- ✗ POTENTIAL SOLUTION:
 - ✗ Convert into 0/1 matrix and then apply existing algorithms
 - ✗ lose word frequency information
 - ✗ Discretization does not apply as users want association among words not ranges of words

Min-Apriori

✗ HOW TO DETERMINE THE SUPPORT OF A WORD?

✗ If we simply sum up its frequency, support count will be greater than total number of documents!

✗ Normalize the word vectors – e.g., using L_1 norm

✗ Each word has a support equals to 1.0

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|----|----|----|----|----|
| D1 | 2 | 2 | 0 | 0 | 1 |
| D2 | 0 | 0 | 1 | 2 | 2 |
| D3 | 2 | 3 | 0 | 0 | 0 |
| D4 | 0 | 0 | 1 | 0 | 1 |
| D5 | 1 | 1 | 1 | 0 | 2 |

Normalize

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

Min-Apriori

✕ NEW DEFINITION OF SUPPORT:

$$\text{sup}(C) = \sum_{i \in T} \min_{j \in C} D(i, j)$$

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

Example:

Sup(W1,W2,W3)

= 0 + 0 + 0 + 0 + 0.17

= 0.17

Anti-monotone property of Support

| TID | W1 | W2 | W3 | W4 | W5 |
|-----|------|------|------|------|------|
| D1 | 0.40 | 0.33 | 0.00 | 0.00 | 0.17 |
| D2 | 0.00 | 0.00 | 0.33 | 1.00 | 0.33 |
| D3 | 0.40 | 0.50 | 0.00 | 0.00 | 0.00 |
| D4 | 0.00 | 0.00 | 0.33 | 0.00 | 0.17 |
| D5 | 0.20 | 0.17 | 0.33 | 0.00 | 0.33 |

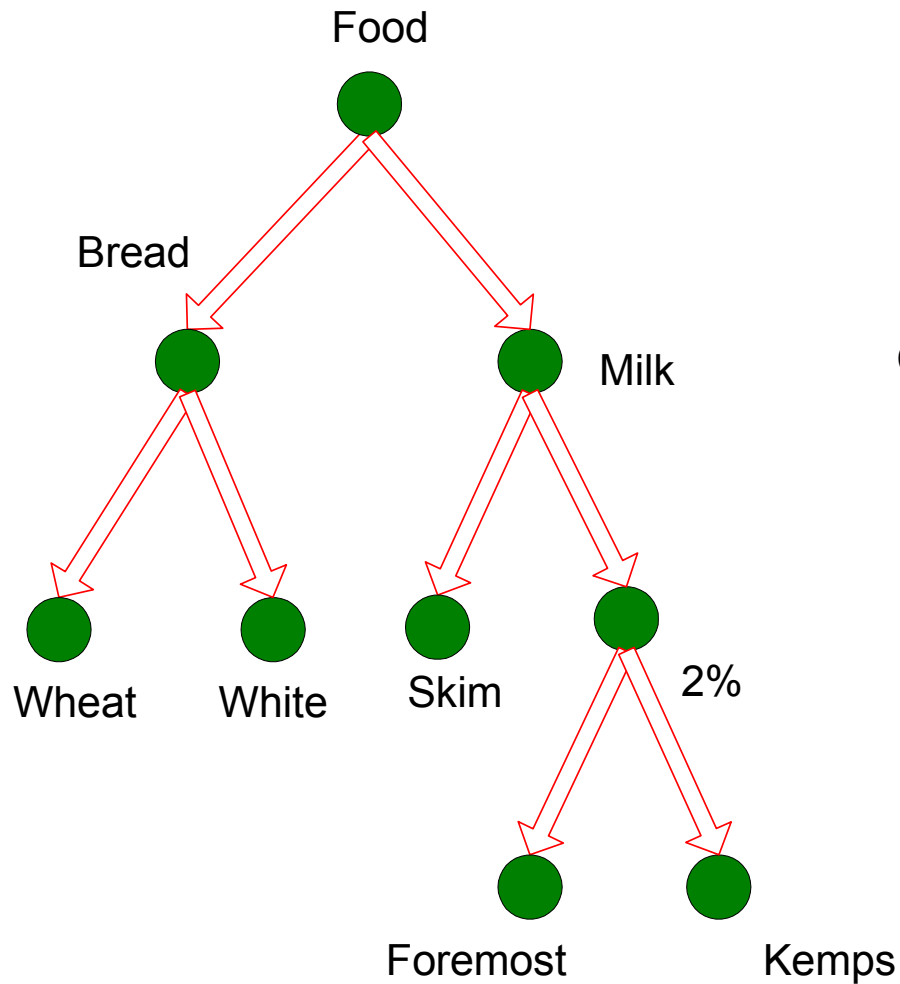

Example:

$$\text{Sup}(W1) = 0.4 + 0 + 0.4 + 0 + 0.2 = 1$$

$$\text{Sup}(W1, W2) = 0.33 + 0 + 0.4 + 0 + 0.17 = 0.9$$

$$\text{Sup}(W1, W2, W3) = 0 + 0 + 0 + 0 + 0.17 = 0.17$$

Multi-level Association Rules

Multi-level Association Rules

x WHY SHOULD WE INCORPORATE CONCEPT HIERARCHY?

- x Rules at lower levels may not have enough support to appear in any frequent itemsets

- x Rules at lower levels of the hierarchy are overly specific

- x e.g., skim milk → white bread, 2% milk → wheat bread, skim milk → wheat bread, etc.

- are indicative of association between milk and bread

Multi-level Association Rules

✕ HOW DO SUPPORT AND CONFIDENCE VARY AS WE TRAVERSE THE CONCEPT HIERARCHY?

✕ If X is the parent item for both $X1$ and $X2$, then
 $\sigma(X) \leq \sigma(X1) + \sigma(X2)$

✕ If $\sigma(X1 \cup Y1) \geq \text{minsup}$,
and X is parent of $X1$, Y is parent of $Y1$
then $\sigma(X \cup Y1) \geq \text{minsup}$, $\sigma(X1 \cup Y) \geq \text{minsup}$
 $\sigma(X \cup Y) \geq \text{minsup}$

✕ If $\text{conf}(X1 \Rightarrow Y1) \geq \text{minconf}$,
then $\text{conf}(X1 \Rightarrow Y) \geq \text{minconf}$

Multi-level Association Rules

✗APPROACH 1:

- ✗Extend current association rule formulation by augmenting each transaction with higher level items

Original Transaction: {skim milk, wheat bread}

Augmented Transaction:

{skim milk, wheat bread, milk, bread, food}

✗ISSUES:

- ✗Items that reside at higher levels have much higher support counts
 - ✗ if support threshold is low, too many frequent patterns involving items from the higher levels
- ✗Increased dimensionality of the data

Multi-level Association Rules

xAPPROACH 2:

- xGenerate frequent patterns at highest level first
- xThen, generate frequent patterns at the next highest level, and so on

xISSUES:

- xI/O requirements will increase dramatically because we need to perform more passes over the data
- xMay miss some potentially interesting cross-level association patterns

Sequence Data

Sequence Database:

| Object | Timestamp | Events |
|--------|-----------|------------|
| A | 10 | 2, 3, 5 |
| A | 20 | 6, 1 |
| A | 23 | 1 |
| B | 11 | 4, 5, 6 |
| B | 17 | 2 |
| B | 21 | 7, 8, 1, 2 |
| B | 28 | 1, 6 |
| C | 14 | 1, 8, 7 |

Examples of Sequence Data

| Sequence Database | Sequence | Element (Transaction) | Event (Item) |
|-------------------|---|--|--|
| Customer | Purchase history of a given customer | A set of items bought by a customer at time t | Books, diary products, CDs, etc |
| Web Data | Browsing activity of a particular Web visitor | A collection of files viewed by a Web visitor after a single mouse click | Home page, index page, contact info, etc |
| Event data | History of events generated by a given sensor | Events triggered by a sensor at time t | Types of alarms generated by sensors |
| Genome sequences | DNA sequence of a particular species | An element of the DNA sequence | Bases A,T,G,C |

Formal Definition of a Sequence

- ✕ A SEQUENCE IS AN ORDERED LIST OF ELEMENTS (TRANSACTIONS)
 - ✕ $s = \langle e_1 e_2 e_3 \dots \rangle$
 - ✕ Each element contains a collection of events (items)
 - ✕ $e_i = \{i_1, i_2, \dots, i_k\}$
 - ✕ Each element is attributed to a specific time or location
- ✕ LENGTH OF A SEQUENCE, $|s|$, IS GIVEN BY THE NUMBER OF ELEMENTS OF THE SEQUENCE
- ✕ A K-SEQUENCE IS A SEQUENCE THAT CONTAINS K EVENTS (ITEMS)

Examples of Sequence

x\WEB SEQUENCE:

< {Homepage} {Electronics} {Digital Cameras} {Canon Digital Camera} {Shopping Cart} {Order Confirmation} {Return to Shopping} >

xSEQUENCE OF INITIATING EVENTS CAUSING THE NUCLEAR ACCIDENT AT 3-MILE ISLAND:

([HTTP://STELLAR-ONE.COM/NUCLEAR/STAFF_REPORTS/SUMMARY_SOE_THE_INITIATING_EVENT.HTM](http://stellar-one.com/nuclear/staff_reports/summary_soe_the_initiating_event.htm))

< {clogged resin} {outlet valve closure} {loss of feedwater}
{condenser polisher outlet valve shut} {booster pumps trip}
{main waterpump trips} {main turbine trips} {reactor pressure increases}>

xSEQUENCE OF BOOKS CHECKED OUT AT A LIBRARY:

<{Fellowship of the Ring} {The Two Towers} {Return of the King}>

Formal Definition of a Subsequence

✗ A SEQUENCE $\langle A_1 A_2 \dots A_N \rangle$ IS CONTAINED IN ANOTHER SEQUENCE $\langle B_1 B_2 \dots B_M \rangle$ ($M \geq N$) IF THERE EXIST INTEGERS

$I_1 < I_2 < \dots < I_N$ SUCH THAT $A_1 \subseteq B_{I_1}, A_2 \subseteq B_{I_2}, \dots, A_N \subseteq B_{I_N}$

| Data sequence | Subsequence | Contain? |
|---|---------------------------------|----------|
| $\langle \{2,4\} \{3,5,6\} \{8\} \rangle$ | $\langle \{2\} \{3,5\} \rangle$ | Yes |
| $\langle \{1,2\} \{3,4\} \rangle$ | $\langle \{1\} \{2\} \rangle$ | No |
| $\langle \{2,4\} \{2,4\} \{2,5\} \rangle$ | $\langle \{2\} \{4\} \rangle$ | Yes |

✗ THE SUPPORT OF A SUBSEQUENCE W IS DEFINED AS THE FRACTION OF DATA SEQUENCES THAT CONTAIN W

✗ A SEQUENTIAL PATTERN IS A FREQUENT SUBSEQUENCE (I.E., A SUBSEQUENCE WHOSE SUPPORT IS $\geq \text{MINSUP}$)

Sequential Pattern Mining: Definition

xGIVEN:

- xa database of sequences
- xa user-specified minimum support threshold, *minsup*

xTASK:

- Find all subsequences with support $\geq minsup$

Sequential Pattern Mining: Challenge

✕ GIVEN A SEQUENCE: $\langle \{A\} \{B\} \{C\} \{D\} \{E\} \{F\} \{G\} \{H\} \{I\} \rangle$

✕ Examples of subsequences:

$\langle \{a\} \{c\} \{d\} \{f\} \{g\} \rangle$, $\langle \{c\} \{d\} \{e\} \rangle$, $\langle \{b\} \{g\} \rangle$, etc.

✕ HOW MANY K-SUBSEQUENCES CAN BE EXTRACTED FROM A GIVEN N-SEQUENCE?

$\langle \{A\} \{B\} \{C\} \{D\} \{E\} \{F\} \{G\} \{H\} \{I\} \rangle$ $N = 9$

Answer :

$$\binom{n}{k} = \binom{9}{4} = 126$$

Sequential Pattern Mining: Example

| Object | Timestamp | Events |
|--------|-----------|---------|
| A | 1 | 1,2,4 |
| A | 2 | 2,3 |
| A | 3 | 5 |
| B | 1 | 1,2 |
| B | 2 | 2,3,4 |
| C | 1 | 1, 2 |
| C | 2 | 2,3,4 |
| C | 3 | 2,4,5 |
| D | 1 | 2 |
| D | 2 | 3, 4 |
| D | 3 | 4, 5 |
| E | 1 | 1, 3 |
| E | 2 | 2, 4, 5 |

Minsup = 50%

Examples of Frequent Subsequences:

| | |
|-----------------|-------|
| < {1,2} > | s=60% |
| < {2,3} > | s=60% |
| < {2,4}> | s=80% |
| < {3} {5}> | s=80% |
| < {1} {2} > | s=80% |
| < {2} {2} > | s=60% |
| < {1} {2,3} > | s=60% |
| < {2} {2,3} > | s=60% |
| < {1,2} {2,3} > | s=60% |

Extracting Sequential Patterns

✕ GIVEN N EVENTS: $i_1, i_2, i_3, \dots, i_N$

✕ CANDIDATE 1-SUBSEQUENCES:

$\langle \{i_1\} \rangle, \langle \{i_2\} \rangle, \langle \{i_3\} \rangle, \dots, \langle \{i_N\} \rangle$

✕ CANDIDATE 2-SUBSEQUENCES:

$\langle \{i_1, i_2\} \rangle, \langle \{i_1, i_3\} \rangle, \dots, \langle \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_2\} \rangle, \dots, \langle \{i_{N-1}\} \{i_N\} \rangle$

✕ CANDIDATE 3-SUBSEQUENCES:

$\langle \{i_1, i_2, i_3\} \rangle, \langle \{i_1, i_2, i_4\} \rangle, \dots, \langle \{i_1, i_2\} \{i_1\} \rangle, \langle \{i_1, i_2\} \{i_2\} \rangle, \dots,$
 $\langle \{i_1\} \{i_1, i_2\} \rangle, \langle \{i_1\} \{i_1, i_3\} \rangle, \dots, \langle \{i_1\} \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_1\} \{i_2\} \rangle, \dots$

Generalized Sequential Pattern (GSP)

- **STEP 1:**
 - Make the first pass over the sequence database D to yield all the 1-element frequent sequences
- **STEP 2:**

REPEAT UNTIL NO NEW FREQUENT SEQUENCES ARE FOUND

 - **Candidate Generation:**
 - ◆ Merge pairs of frequent subsequences found in the $(k-1)th$ pass to generate candidate sequences that contain k items
 - **Candidate Pruning:**
 - ◆ Prune candidate k -sequences that contain infrequent $(k-1)$ -subsequences
 - **Support Counting:**
 - ◆ Make a new pass over the sequence database D to find the support for these candidate sequences
 - **Candidate Elimination:**
 - ◆ Eliminate candidate k -sequences whose actual support is less than *minsup*

Candidate Generation

✕BASE CASE ($K=2$):

✕Merging two frequent 1-sequences $\langle\{i_1\}\rangle$ and $\langle\{i_2\}\rangle$ will produce two candidate 2-sequences: $\langle\{i_1\} \{i_2\}\rangle$ and $\langle\{i_1 i_2\}\rangle$

✕GENERAL CASE ($K>2$):

✕A frequent $(k-1)$ -sequence w_1 is merged with another frequent $(k-1)$ -sequence w_2 to produce a candidate k -sequence if the subsequence obtained by removing the first event in w_1 is the same as the subsequence obtained by removing the last event in w_2

✕ The resulting candidate after merging is given by the sequence w_1 extended with the last event of w_2 .

✕If the last two events in w_2 belong to the same element, then the last event in w_2 becomes part of the last element in w_1

✕Otherwise, the last event in w_2 becomes a separate element appended to the end of w_1

Candidate Generation Examples

✗MERGING THE SEQUENCES

$W_1 = \langle \{1\} \{2\ 3\} \{4\} \rangle$ AND $W_2 = \langle \{2\ 3\} \{4\ 5\} \rangle$

WILL PRODUCE THE CANDIDATE SEQUENCE $\langle \{1\} \{2\ 3\} \{4\ 5\} \rangle$ BECAUSE THE LAST TWO EVENTS IN W_2 (4 AND 5) BELONG TO THE SAME ELEMENT

✗MERGING THE SEQUENCES

$W_1 = \langle \{1\} \{2\ 3\} \{4\} \rangle$ AND $W_2 = \langle \{2\ 3\} \{4\} \{5\} \rangle$

WILL PRODUCE THE CANDIDATE SEQUENCE $\langle \{1\} \{2\ 3\} \{4\} \{5\} \rangle$ BECAUSE THE LAST TWO EVENTS IN W_2 (4 AND 5) DO NOT BELONG TO THE SAME ELEMENT

✗WE DO NOT HAVE TO MERGE THE SEQUENCES

$W_1 = \langle \{1\} \{2\ 6\} \{4\} \rangle$ AND $W_2 = \langle \{1\} \{2\} \{4\ 5\} \rangle$

TO PRODUCE THE CANDIDATE $\langle \{1\} \{2\ 6\} \{4\ 5\} \rangle$ BECAUSE IF THE LATTER IS A VIABLE CANDIDATE, THEN IT CAN BE OBTAINED BY MERGING W_1 WITH $\langle \{1\} \{2\ 6\} \{5\} \rangle$

GSP Example

Frequent 3-sequences

$\langle \{1\} \{2\} \{3\} \rangle$
 $\langle \{1\} \{2\ 5\} \rangle$
 $\langle \{1\} \{5\} \{3\} \rangle$
 $\langle \{2\} \{3\} \{4\} \rangle$
 $\langle \{2\ 5\} \{3\} \rangle$
 $\langle \{3\} \{4\} \{5\} \rangle$
 $\langle \{5\} \{3\ 4\} \rangle$

Candidate Generation

$\langle \{1\} \{2\} \{3\} \{4\} \rangle$
 $\langle \{1\} \{2\ 5\} \{3\} \rangle$
 $\langle \{1\} \{5\} \{3\ 4\} \rangle$
 $\langle \{2\} \{3\} \{4\} \{5\} \rangle$
 $\langle \{2\ 5\} \{3\ 4\} \rangle$

Candidate Pruning

$\langle \{1\} \{2\ 5\} \{3\} \rangle$

Timing Constraints (I)

x_g : max-gap

n_g : min-gap

m_s : maximum span

$$x_g = 2, n_g = 0, m_s = 4$$

| Data sequence | Subsequence | Contain? |
|---|-------------------------------------|----------|
| $\langle \{2,4\} \{3,5,6\} \{4,7\} \{4,5\} \{8\} \rangle$ | $\langle \{6\} \{5\} \rangle$ | Yes |
| $\langle \{1\} \{2\} \{3\} \{4\} \{5\} \rangle$ | $\langle \{1\} \{4\} \rangle$ | No |
| $\langle \{1\} \{2,3\} \{3,4\} \{4,5\} \rangle$ | $\langle \{2\} \{3\} \{5\} \rangle$ | Yes |
| $\langle \{1,2\} \{3\} \{2,3\} \{3,4\} \{2,4\} \{4,5\} \rangle$ | $\langle \{1,2\} \{5\} \rangle$ | No |

Mining Sequential Patterns with Timing Constraints

xAPPROACH 1:

- xMine sequential patterns without timing constraints
- xPostprocess the discovered patterns

xAPPROACH 2:

- xModify GSP to directly prune candidates that violate timing constraints
- xQuestion:
 - x Does Apriori principle still hold?

Apriori Principle for Sequence Data

| Object | Timestamp | Events |
|--------|-----------|---------|
| A | 1 | 1,2,4 |
| A | 2 | 2,3 |
| A | 3 | 5 |
| B | 1 | 1,2 |
| B | 2 | 2,3,4 |
| C | 1 | 1, 2 |
| C | 2 | 2,3,4 |
| C | 3 | 2,4,5 |
| D | 1 | 2 |
| D | 2 | 3, 4 |
| D | 3 | 4, 5 |
| E | 1 | 1, 3 |
| E | 2 | 2, 4, 5 |

Suppose:

$x_g = 1$ (max-gap)

$n_g = 0$ (min-gap)

$m_s = 5$ (maximum span)

$minsup = 60\%$

$\langle \{2\} \{5\} \rangle$ support = 40%

but

$\langle \{2\} \{3\} \{5\} \rangle$ support = 60%

Problem exists because of max-gap constraint

No such problem if max-gap is infinite

Contiguous Subsequences

- S IS A CONTIGUOUS SUBSEQUENCE OF

$$W = \langle E_1 \rangle \langle E_2 \rangle \dots \langle E_k \rangle$$
 IF ANY OF THE FOLLOWING CONDITIONS HOLD:
 1. s is obtained from w by deleting an item from either e_1 or e_k
 2. s is obtained from w by deleting an item from any element e_i that contains more than 2 items
 3. s is a contiguous subsequence of s' and s' is a contiguous subsequence of w (recursive definition)

- EXAMPLES: $S = \langle \{1\} \{2\} \rangle$
 - is a contiguous subsequence of
 $\langle \{1\} \{2\} \{3\} \rangle$, $\langle \{1\} \{2\} \{2\} \{3\} \rangle$, and $\langle \{3\} \{4\} \{1\} \{2\} \{2\} \{3\} \{4\} \rangle$
 - is not a contiguous subsequence of
 $\langle \{1\} \{3\} \{2\} \rangle$ and $\langle \{2\} \{1\} \{3\} \{2\} \rangle$

Modified Candidate Pruning Step

✗ WITHOUT MAXGAP CONSTRAINT:

✗ A candidate k -sequence is pruned if at least one of its $(k-1)$ -subsequences is infrequent

✗ WITH MAXGAP CONSTRAINT:

✗ A candidate k -sequence is pruned if at least one of its **contiguous** $(k-1)$ -subsequences is infrequent

Timing Constraints (II)

x_g : max-gap

n_g : min-gap

ws: window size

m_s : maximum span

$x_g = 2$, $n_g = 0$, **ws = 1**, $m_s = 5$

| Data sequence | Subsequence | Contain? |
|---|-----------------------------------|----------|
| $\langle \{2,4\} \{3,5,6\} \{4,7\} \{4,6\} \{8\} \rangle$ | $\langle \{3\} \{5\} \rangle$ | No |
| $\langle \{1\} \{2\} \{3\} \{4\} \{5\} \rangle$ | $\langle \{1,2\} \{3\} \rangle$ | Yes |
| $\langle \{1,2\} \{2,3\} \{3,4\} \{4,5\} \rangle$ | $\langle \{1,2\} \{3,4\} \rangle$ | Yes |

Modified Support Counting Step

✗ GIVEN A CANDIDATE PATTERN: $\langle \{A, C\} \rangle$

✗ Any data sequences that contain

$\langle \dots \{a\} \{c\} \dots \rangle$,

$\langle \dots \{a\} \dots \{c\} \dots \rangle$ (where $\text{time}(\{c\}) - \text{time}(\{a\}) \leq ws$)

$\langle \dots \{c\} \dots \{a\} \dots \rangle$ (where $\text{time}(\{a\}) - \text{time}(\{c\}) \leq ws$)

will contribute to the support count of candidate pattern

Other Formulation

✗ IN SOME DOMAINS, WE MAY HAVE ONLY ONE VERY LONG TIME SERIES

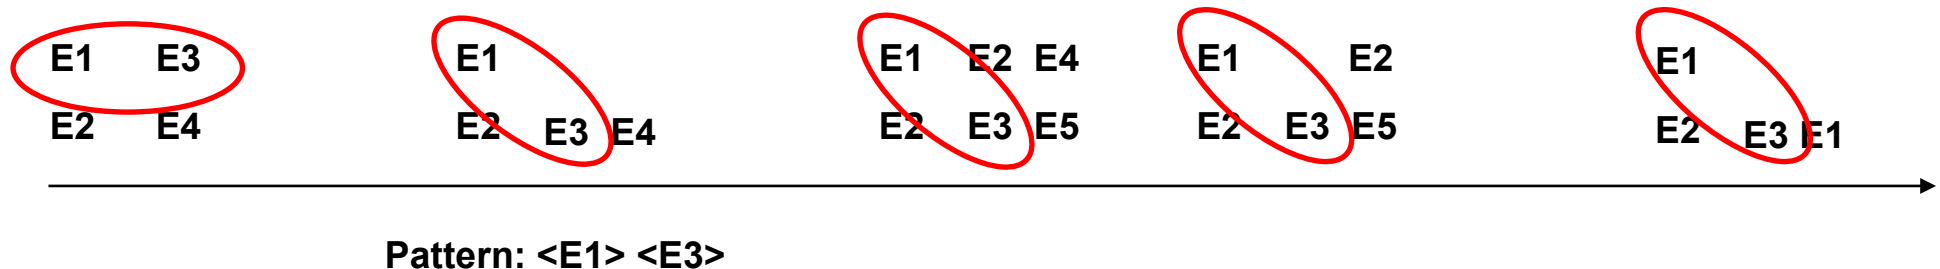

✗ Example:

✗ monitoring network traffic events for attacks

✗ monitoring telecommunication alarm signals

✗ GOAL IS TO FIND FREQUENT SEQUENCES OF EVENTS IN THE TIME SERIES

✗ This problem is also known as frequent episode mining

CWIN 6

CMINWIN 4

CDIST_O 8

CDIST 5

Assume:

$x_g = 2$ (max-gap)

$n_g = 0$ (min-gap)

$ws = 0$ (window size)

$m_s = 2$ (maximum span)

Frequent Subgraph Mining

- ✗ EXTEND ASSOCIATION RULE MINING TO FINDING FREQUENT SUBGRAPHS
- ✗ USEFUL FOR WEB MINING, COMPUTATIONAL CHEMISTRY, BIOINFORMATICS, SPATIAL DATA SETS, ETC

Graph Definitions

(a) Labeled Graph

(b) Subgraph

(c) Induced Subgraph

Representing Transactions as Graphs

× EACH TRANSACTION IS A CLIQUE OF ITEMS

| Transaction Id | Items |
|----------------|--------------|
| 1 | {A, B, C, D} |
| 2 | {A, B, E} |
| 3 | {B, C} |
| 4 | {A, B, D, E} |
| 5 | {B, C, D} |

| G3 | 0 | 0 | 1 | 1 | 0 | 0 | ... | 0 |
| G3 | ... | ... | ... | ... | ... | ... | ... | ... |

Challenges

- ✗ NODE MAY CONTAIN DUPLICATE LABELS
- ✗ SUPPORT AND CONFIDENCE
 - ✗ How to define them?
- ✗ ADDITIONAL CONSTRAINTS IMPOSED BY PATTERN STRUCTURE
 - ✗ Support and confidence are not the only constraints
 - ✗ Assumption: frequent subgraphs must be connected
- ✗ APRIORI-LIKE APPROACH:
 - ✗ Use frequent k -subgraphs to generate frequent $(k+1)$ subgraphs
 - ✗ What is k ?

Challenges...

- ✗SUPPORT:

- ✗number of graphs that contain a particular subgraph

- ✗APRIORI PRINCIPLE STILL HOLDS

- ✗LEVEL-WISE (APRIORI-LIKE) APPROACH:

- ✗Vertex growing:

- ✗ k is the number of vertices

- ✗Edge growing:

- ✗ k is the number of edges

Vertex Growing

G1

+

G2

G3 = join(G1, G2)

$$M_{G_1} = \begin{pmatrix} 0 & p & p & q \\ p & 0 & r & 0 \\ p & r & 0 & 0 \\ q & 0 & 0 & 0 \end{pmatrix}$$

$$M_{G_2} = \begin{pmatrix} 0 & p & p & 0 \\ p & 0 & r & 0 \\ p & r & 0 & r \\ 0 & 0 & r & 0 \end{pmatrix}$$

$$M_{G_3} = \begin{pmatrix} 0 & p & p & 0 & q \\ p & 0 & r & 0 & 0 \\ p & r & 0 & r & 0 \\ 0 & 0 & r & 0 & 0 \\ q & 0 & 0 & 0 & 0 \end{pmatrix}$$

Edge Growing

Apriori-like Algorithm

- ✗ FIND FREQUENT 1-SUBGRAPHS
- ✗ REPEAT
 - ✗ Candidate generation
 - ✗ Use frequent $(k-1)$ -subgraphs to generate candidate k -subgraph
 - ✗ Candidate pruning
 - ✗ Prune candidate subgraphs that contain infrequent $(k-1)$ -subgraphs
 - ✗ Support counting
 - ✗ Count the support of each remaining candidate
 - ✗ Eliminate candidate k -subgraphs that are infrequent

In practice, it is not as easy. There are many other issues

Example: Dataset

- The same graph can be represented in many ways

Graph Isomorphism

✗ A GRAPH IS ISOMORPHIC IF IT IS TOPOLOGICALLY EQUIVALENT TO ANOTHER GRAPH

Graph Isomorphism

✗TEST FOR GRAPH ISOMORPHISM IS NEEDED:

- ✗During candidate generation step, to determine whether a candidate has been generated
- ✗During candidate pruning step, to check whether its $(k-1)$ -subgraphs are frequent
- ✗During candidate counting, to check whether a candidate is contained within another graph

Graph Isomorphism

✗ USE CANONICAL LABELING TO HANDLE ISOMORPHISM

✗ Map each graph into an ordered string representation (known as its code) such that two isomorphic graphs will be mapped to the same canonical encoding

✗ Example:

✗ Lexicographically largest adjacency matrix
